

- Rats breed rapidly, are versatile in their movement and consume huge quantities of food in relation to body weight.
- Sexual maturity is attained in just 2 to 3 months. In the following year the female produces six to seven litters of six to ten offspring.
- Signs of rat infestation include "runways", smears, droppings, gnawing and tracks.

A population of 100 adult rats, typically consuming 28 g/day, can eat their way through 1 ton of feed grain or finished feed per year.

Features and Benefits of the Rat Bait Box

- Durable, minimising the risk of damage which can be caused by livestock or farm machinery
- Lock and key mechanism protects the rat bait from non-target animals and children
- Weight of box means that it will not blow away or tip over in high winds
- Suitable for use with wax bait blocks and/or traditional pellets
- Easy to clean and refill
- Designed to sit flush against existing walls and barriers
